

- Objective: To construct a VLAN and make the PC's communicate among a VLAN.

### • Topology:

### • Procedure:

- create a topology with 4 PCs, 1 Router and 1 switch as shown above.
- Assign IP address as shown in the topology.

- iii) Go to the switch  $\rightarrow$  VLAN Database to configure the VLAN. Give VLAN number and VLAN name, add it.
- iv) Select the interface ie fastEthernet 0/0 (leave the switch from router) and make it trunk.

(VLAN trunking allows switches to forwards frames from different VLANs over a single link called trunk).

- v) To make router understand VLAN. Go to config tab of router, select VLAN database, enter the number and name of VLAN created.

Go to CLI

Router (Vlan) # exit

Router # config t

Router (config) # interface fastEthernet 0/0:1

Router (config) #

# encapsulation dot1q 2

# ip address 192.168.21.255

# no shut

# exit

# exit

### • Observation

1. Proper trunk configuration is established & make VLAN work properly
2. Ping from one VLAN to another works properly.
